

Envelope printing on the BaumPrint 18

Cut spring to the length shown.

You will have to work with the length to see what works for you. The springs shown both worked well in the demo room on a new BaumPrint 18.

Place the spring on the press as show. It would be a good idea to zip tie the spring to the press. This spring softens the downward pressure of the bar so it doesn't smash the envelopes. The envelopes will stay flatter and will remain less disturbed with this method. You should be able to run stacks of 500 envelopes with this method. If the envelopes are curled or glued together this will help but won't correct everything.

See below the original package with size and weight.

I hope this helps.
