

Gentlemen and fellow Lithographers,

From – “very little professional input contributor”

May I say that Dan T.Roll contribution is “Very Professional”

But, I ask why should we be spending hours of press downtime cleaning plates and contaminating the F.S.?

The plates should be - Washed –Out with clean water after using the plate cleaner.

Standard Operating Procedures (S.O.P) and Alkaline Plate Finishers.

Plates arrive “gummed –up” after plate mounting, we have a

Sequential Press Start, result contaminated F.S. over time.

My conclusion is Paper, after having printed on Millions of Meters! Seen and experienced problems of using Alkaline –PCC paper

Regards, Alois
