

I'm in total despair – Now!

Hello fellow Lithographers and LukeW

Pray do tell me – how does one clean the compliant roller systems of a Offset press, when covered in printing ink, by just using IPA (Alcohol) when the said roller trains are made from a synthetic material namely BunaN, which is inherently “Oleophilic” when the only solvent which does this task very effectively is a Petroleum Based Distillate e.g. Roller/Blanket Wash.

I eagerly await your answers, so I can amend the practices accumulated over 200 years of experience in Lithographic Printing!

Regards, Alois
